

SunClean™ V3-25 Technology

SunClean V3-25, a state of the art wash / cleaner designed to remove solvent-based, UV and cross-linked water-based inks from anilox rollers and presses. This unique technology dissolves and lifts dried / cured inks out of anilox cells to provide optimum volume.

Minimize or eliminate soda blasting and other cleaning processes that save an enormous amount of pressroom cost.

Reduce ink color changes for color matching. Spot cleaning or cleaning as a standard operating procedure - using this cleaner virtually eliminates the need to stop the press and adjust inks to match colors.

Improve production time. The time to clean the anilox is dramatically shortened compared to the cleaning time associated with soda blasting or other processes. Improved productivity as a result of not having to shut down the press to adjust inks for color matching.
